Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    166

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2 suppression (By similarity).

SUBDINIT: Binds DNA as a homotetramer (By similarity).

SUBCELLULAR LOCATION: Nuclear.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -MAR-1989
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expression (By similarity).
SUBUNIT: Binds DNA as a homotetramer (By similarity).
SUBCELLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2

Involved in cell cycle regulation a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation cell and fas antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in many types of cancer.
SIMILARITY: BELONGS TO THE P53 FAMILY.

             FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Input of cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.
   Apoptosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes regulared for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases apoptosis induction seems to be mediated either by stimulation of

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in many types of cancer.
SIMILARITY: BELONGS TO THE P53 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression.

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of

                                                                                            SUBUNIT: Binds DNA as a homotetramer SUBCELLULAR LOCATION: Nuclear. DISEASE: p53 is found in increased am of transformed cells. p53 is frequent in many types of cancer.
                                                                                                                                                                                                                                    growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation on the process of Bcl-2 and FAS antigen expression, or by repression of Bcl-2
                                                                        in many types of cancer.

SEQUENCE FROM N.A. Hagiwara K., McMenamin M.G., Harris C.G.; Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases. Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases. FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES; INDUCES OF ERROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTANCES AND CELL TYPE. INVOLVED IN CELL CYCLE REGULATION AS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.	SEQUENCE FROM N.A. EXPRESSION (BY SIMILARITY).

SUBUNIT: BINDS DNA AS A HOMOTETRAMER (BY SIMILARITY).

SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN I
TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OF
MANY TYPES OF CANCER (BY SIMILARITY).

SIMILARITY: BELONGS TO THE P53 FAMILY.

SIMILARITY: ACC62642.1; -.

SP; P04637; 1YCS.
                                                                                                                 FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES; INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTRACCES AND CELL TYPE. INVOLVED IN CELL CYCLE REGULATION AS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES. APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           375

CIPCUTON: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES; INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CROWTH ARREST OR APOPTOSIS INDUCTOR SENSOR THIS PROCESS. ONE OF THE ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE ORD OF THE ACTIVATED GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

CHAPOPTOSIS INDUCTION SEEMS TO BE MEDITATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2 EXPRESSION (BY SIMILARITY).

CHORDOLOGY.

CHAPTER AND ARREST OF THE PHYSION OF BCL-2 CONDITIONS OF BCL-2 CONDITIONS
